## Is your ERP system Industry 4.0 compatible?

### New connections between machines, production processes and systems

Industry 4.0 calls for a future of agile, affordable manufacturing fuelled by technology enablers such as the Internet of Things (IoT), 3D printing, cloud computing, mobile devices and big data. This will marry the world of production and networking in a connected environment. Enterprise resource planning (ERP) will become even more central to production in this environment. The ERP system will become the backbone to the network; connecting smart machines, logistics systems, production facilities, sensors and devices as products and machines communicate with each other and exchange commands as products move the production line.
